## 1.PROJECT BACKGROUND AND SCOPE

SwiftShip Tracker is a Salesforce-oriented parcel management solution intended to bring booking, shipment visibility, delivery updates and customer assistance into a single working environment. Instead of maintaining these activities manually, the application combines Salesforce custom objects, Flow Builder, Prompt Builder and Agentforce to support the parcel lifecycle. The main focus of the project is to make parcel information easier to maintain and retrieve while reducing repetitive administrative work. Customers can obtain shipment information, delivery personnel can update parcel progress, and administrators can control records, access and reports from the same platform. The solution is designed as an academic/prototype implementation inside a Salesforce Developer Org. Its purpose is to demonstrate how CRM data, automation and an AI service agent can work together for parcel tracking.

**Key outcomes** • Centralize parcel, sender, receiver and delivery information.

- Reduce manual effort involved in checking and updating shipment records.
- Provide users with parcel status information through an Agentforce interface.
- Use Salesforce automation for retrieving records and preparing responses.
- Protect project data using profiles, permission sets, role hierarchy, sharing controls and field-level security.

This project demonstrates how CRM data and AI-driven automation can streamline logistics processes, making parcel tracking more efficient and reliable.

## 2. Planning and Requirement Study

**Project Need:** The need was identified for a simple parcel-tracking application where shipment details are entered once and reused across booking, delivery, and customer support activities.

### Objectives:

- Simplify parcel registration and tracking.
- Automate delivery-status communication and email notifications.
- Provide delivery staff with clear visibility of assigned parcels.
- Allow customers/support staff to access current shipment information.
- Restrict access based on user responsibilities.

### User Roles:

- **Customer** → books parcels, checks progress, receives updates.
- **Delivery Agent** → views assigned shipments, updates delivery status.
- **Administrator** → manages users, records, security, and reporting.
- **Support Team** → responds to customer queries and delivery issues.

**Salesforce Components Used:** Custom Objects, Flow Builder, Prompt Builder, Agentforce AI, Apex, Email Alerts, Reports, Dashboards.

## Data Structure:

- Parcel\_c → ID, status, weight, delivery info.
- Sender\_c → sender contact/address.
- Receiver\_c → recipient contact/address.
- Delivery\_c → progress, location, delivery date.

This modular structure ensures data consistency while maintaining flexibility for reporting and automation.

## 3. Salesforce Application Configuration

### 3.1 Custom Objects and Initial Setup

Parcel:

Delivery:

Sender:

Receiver:

Created **Parcel, Delivery, Sender, Receiver** objects with proper labels, record names, reporting, search, and field-history tracking enabled.

## 3.2 Tabs, Fields and Object Relationships

Tabs:

Custom tabs were created for each object. Fields include Parcel ID, Status, Weight, Estimated Delivery Date, Sender/Receiver lookups, Delivery Status, Location, Assigned Agent, etc.

### 3.3 Prompt Builder and Flow Automation

Prompt Builder templates convert parcel data into tracking responses. An Auto-Launched Flow connects parcel records with Agentforce, retrieves data, and returns formatted output.

### 3.4 Functional Verification

Testing covered parcel retrieval, valid/invalid IDs, Flow outputs, and user permissions.

## 4. Agentforce Design and Enablement

### 4.1 Permission Configuration

A **SwiftShip permission set** was created with Einstein Agent license and assigned to the Service Agent user.

### 4.2 Agent Creation, Actions and Activation

The **SwiftShip Tracker Service Agent** was configured with instructions, topics, and parcel-tracking Flow as an action. It was activated after confirming topics, actions, and Flow access.

## 5. Data Validation, Testing and Access Control

- Verified agent routing and Flow responses.
- Validated parcel records, sender/receiver links, and delivery updates.
- Ensured secure access control through profiles and permission sets.

## 6. Deployment, Support and Documentation

- Deployment validated in Salesforce Developer Org.
- Monitoring processes established for issue resolution.
- Documentation maintained with project records, screenshots, and configuration details.

## 7. Final Summary

SwiftShip Tracker demonstrates how **Salesforce CRM, automation, and AI agents** can streamline parcel tracking. It centralizes data, automates updates, and secures access, reducing administrative overhead while improving customer satisfaction.

## Conclusion

The project highlights the potential of combining **Salesforce automation tools with AI-driven service agents** to solve real-world logistics challenges. Although developed as an academic prototype, SwiftShip Tracker provides a scalable foundation for future enterprise-level parcel management systems. By integrating **Custom Objects, Flow Builder, Prompt Builder, and Agentforce**, the solution showcases how technology can transform traditional manual processes into a smart, automated, and user-friendly system.
